

ASTRA-SIM Description

Saeed Rashidi

Ph.D. Student, School of Electrical & Computer Engineering
Georgia Institute of Technology

saeed.rashidi@gatech.edu

Acknowledgments: Srinivas Sridharan (Facebook), Sudarshan Srinivasan (Intel)

Agenda

Time (CET)	Time (ET)	Topic	Presenter
15:00 – 16:00	9:00 – 10:00	Introduction to Distributed Deep Learning Training Platforms	Tushar Krishna
16:00 – 17:00	10:00 – 11:00	ASTRA-sim	Saeed Rashidi
17:00 – 17:10	11:00 – 11:10	Break	
17:10 – 17:50	11:10 – 11:50	Demo and Exercises	William Won and Taekyung Heo
17:50 – 18:00	11:50 – 12:00	Extensions and Future Development	Tushar Krishna and Saeed Rashidi

Tutorial Website

includes agenda, slides, ASTRA-sim installation instructions (via source + docker image)

<https://astra-sim.github.io/tutorials/asplos-2022>

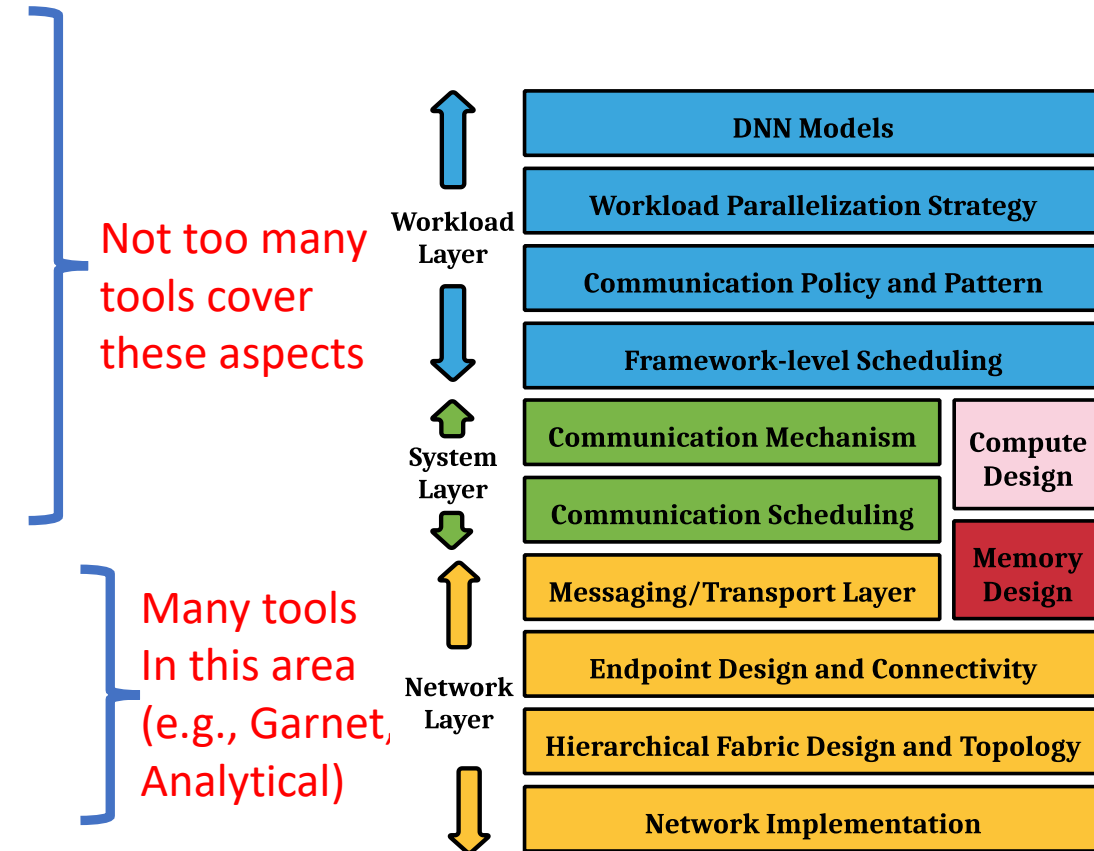

Attention: Tutorial is being recorded

Overview

How to Model and Evaluate the Communication Effect

- It is a complex problem and can be viewed as three layers :

- 1. Workload layer (the training loop):
 - Parallelism approach
 - Compute power
 - Communication size & type and dependency order
- 2. System layer:
 - Collective communication algorithm
 - Chunk size, schedule of collectives
- 3. Network layer:
 - Physical topology
 - Congestion control, communication protocol
 - Link BW, latency, buffers, routing algorithm

ASTRA-SIM Architecture

- Workload layer:

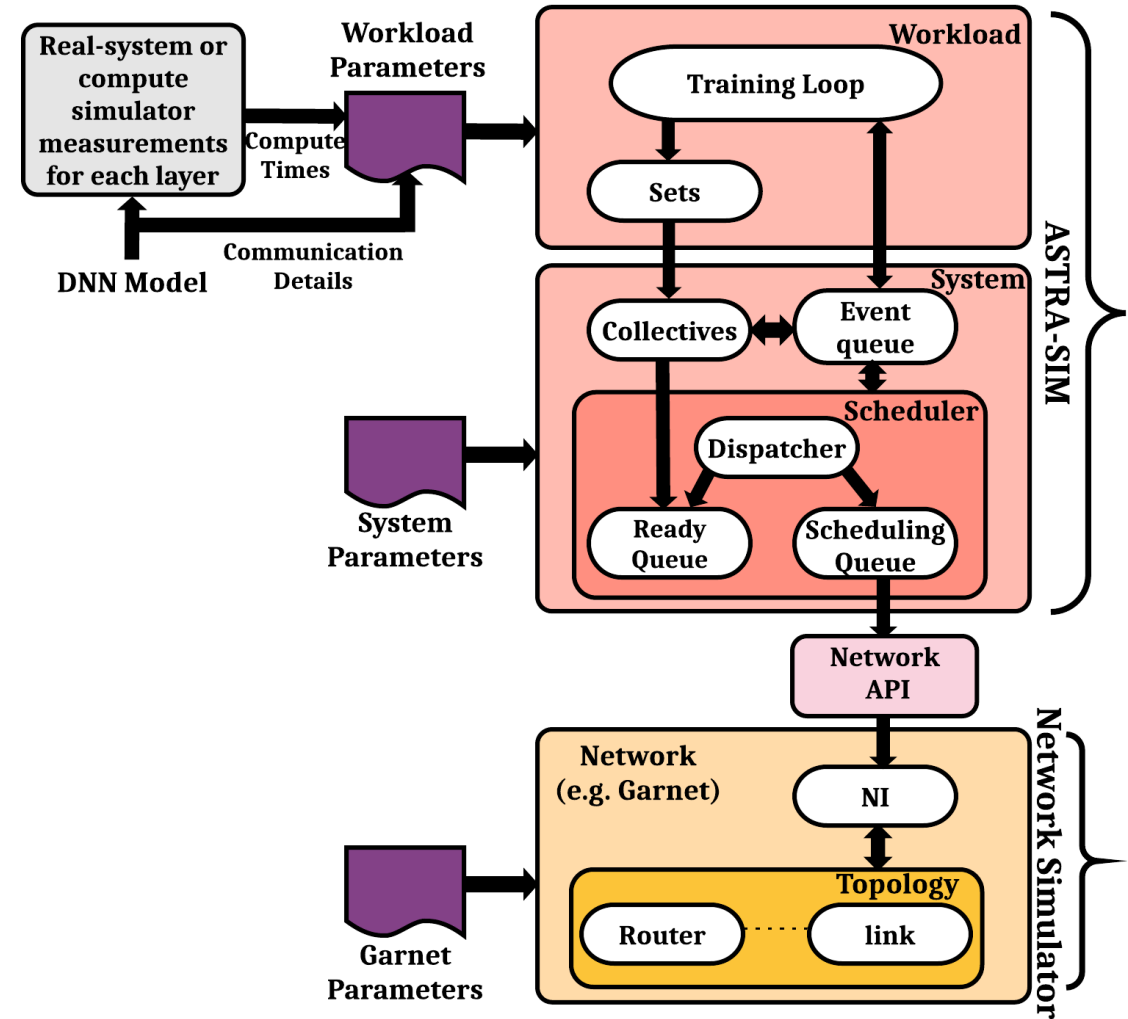

- Supports Data-Parallel, Model-Parallel, Hybrid-Parallel training loops
- Easy to add new arbitrary training loop

- System:

- Ring based, Tree-based, AlltoAll based, and multi-phase collectives
- Easy to add new collective communication

- Network:

- Supports Analytical and GARNET Network simulator
- Analytical:
 - Supports hierarchical topologies
 - Each level in hierarchy can be switch, ring, FC....
 - <https://github.com/astra-sim/analytical/tree/develop>
- GARNET:
 - Supports switch-based and torus-based topologies
 - Supports credit-based flow control
 - https://github.com/georgia-tech-synergy-lab/gem5_astra/tree/reorgV2
- Can add new topologies in both Analytical and GARNET

ASTRA-SIM Runtime Structure

- Each NPU is represented through separate instance of Workload, System, and Network API.
- Network API class is implemented by the network backend.

8 reduce-scatter-implementation: ring_ring_ring
9 all-to-all-implementation: ring_ring_ring
10 collective-optimization: localBWAware
11
```

Network Layer

Network Layer Structure

- Network backends are maintained separately and are imported as **submodule**.

Simulation Control Flow

- The main file is implemented inside network layer.
- Network layer creates corresponding System and NetworkAPI instances.
- Each system layer instance **internally** creates its workload layer instance.

Where do instantiations happen?

Analytical backend: analytical/src/main.cc

Garnet backend: garnet/gem5_astra/src/mem/ruby/network/garnet2.0/NetworkInterface.cc

Network Layer

```
void main(){  
    .....  
    Instantiate NetworkAPI[];  
    Instantiate System[];  
    .....  
    for(auto &s:system){  
        s->workload.fire();  
    }  
    process_all_events();  
    return;  
}
```

Garnet vs. Analytical

- Regular topologies + topology-aware collectives make traffic patterns to be congestionless (in most cases), enabling analytical backend to calculate latencies fast and accurately.

Analytical	Garnet
Supports hierarchical topologies	Supports switch-based and torus-based topologies
Each level in hierarchy can be switch, ring, FC	Supports credit-based flow control
Uses simple link latency, BW analytical model to get latency.	Performs packetization, flow control, congestion modeling, etc.
Fast	Slow for large systems & big models
Accurate when comm patterns are congestionless.	Accurate in all scenarios.

Network Input

Garnet network input

```
sample_torus.txt

ResNet-50 Layer-Wise Raw Comm Latency

- A Torus 3D with total of 32 (2X4X4) nodes is used.
- Data parallel approach is used.
- Raw latency depends on the comm size plus the priority of each layer comm (queuing delay).

ResNet-50 Layer-Wise Compute vs. Exposed Comm Latency

- Exposed comm latency is observed for the first layer. because by the time we reach other layers except that. first layer, their comm is already finished.

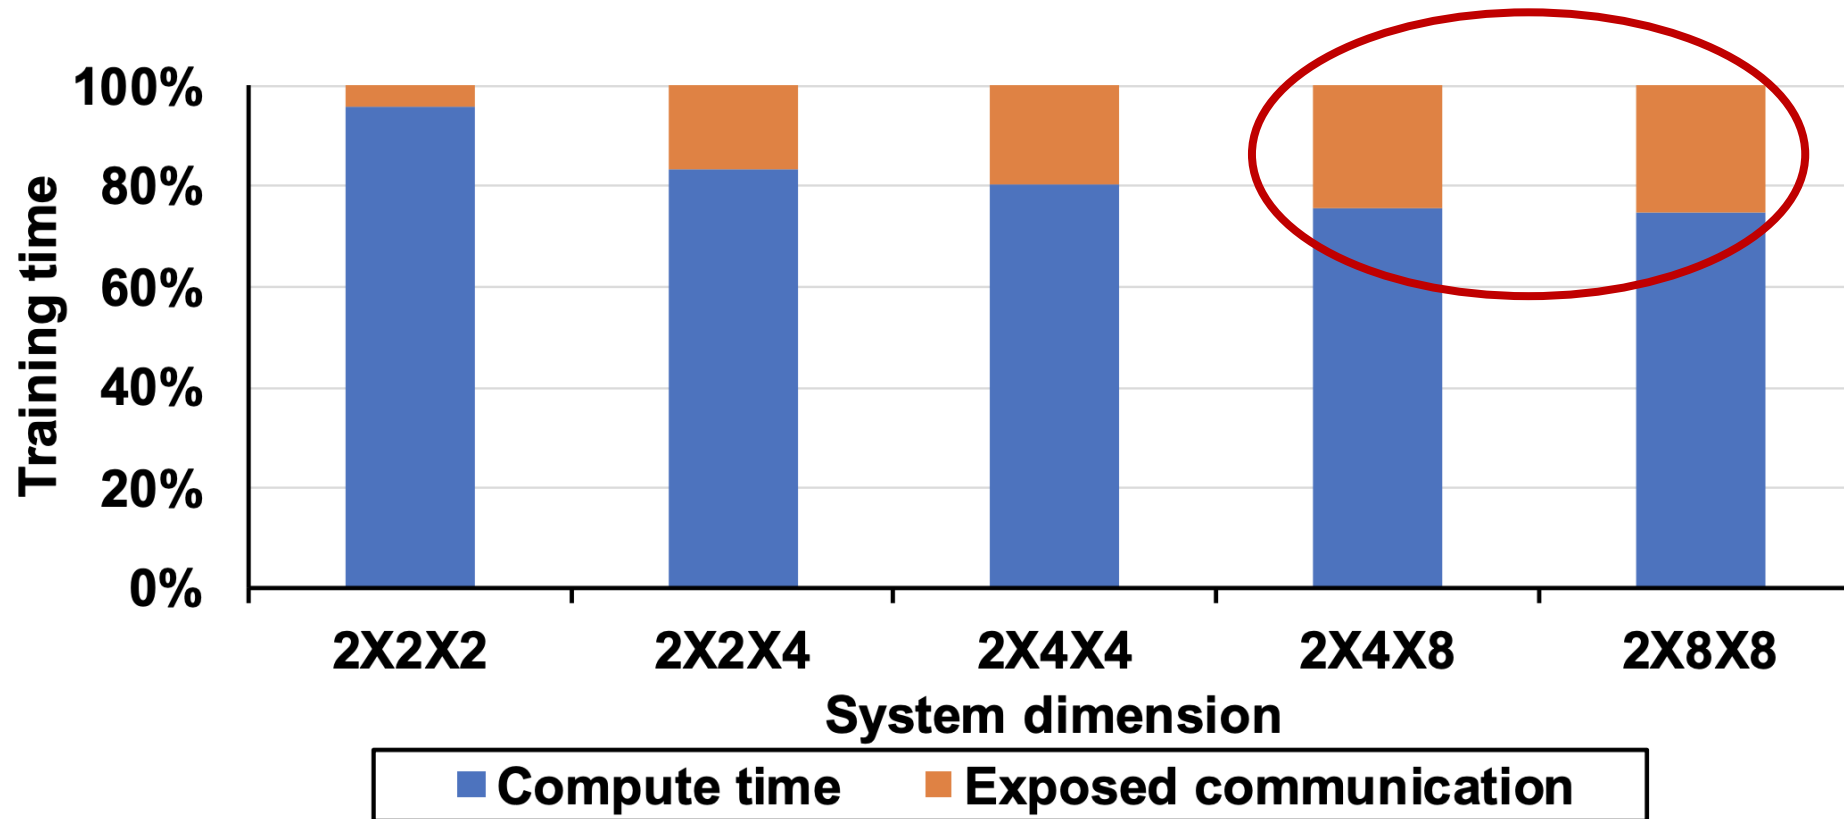

ResNet-50 Layer-Wise detailed latency

- Queue P2 is becoming the dominant factor due to very high speed of P1 (within package) that results most of the chunks get queued for the next phase (P2).

Effect of # of nodes on the Ratio of Total Compute vs Total Exposed Comm for ResNet-50

- A Torus 3D with total of 8, 16, 32, 64, 128 nodes are used.

Effect of Enhanced Compute Time per Node on the Ratio of Total Compute vs Total Exposed Comm for ResNet-50

- A Torus 3D with total of 32 nodes (2X4X4) is used.

Workload Generator

Workload Generator

- Should receive the GEMM operations (M, N, K dimensions) and the parallelization strategy as input.
- It uses SCALE-SIM simulator to find the compute times.
- Please see [astra-sim/scripts/workload_generator/README.md](#).

Sample script to call workload generator

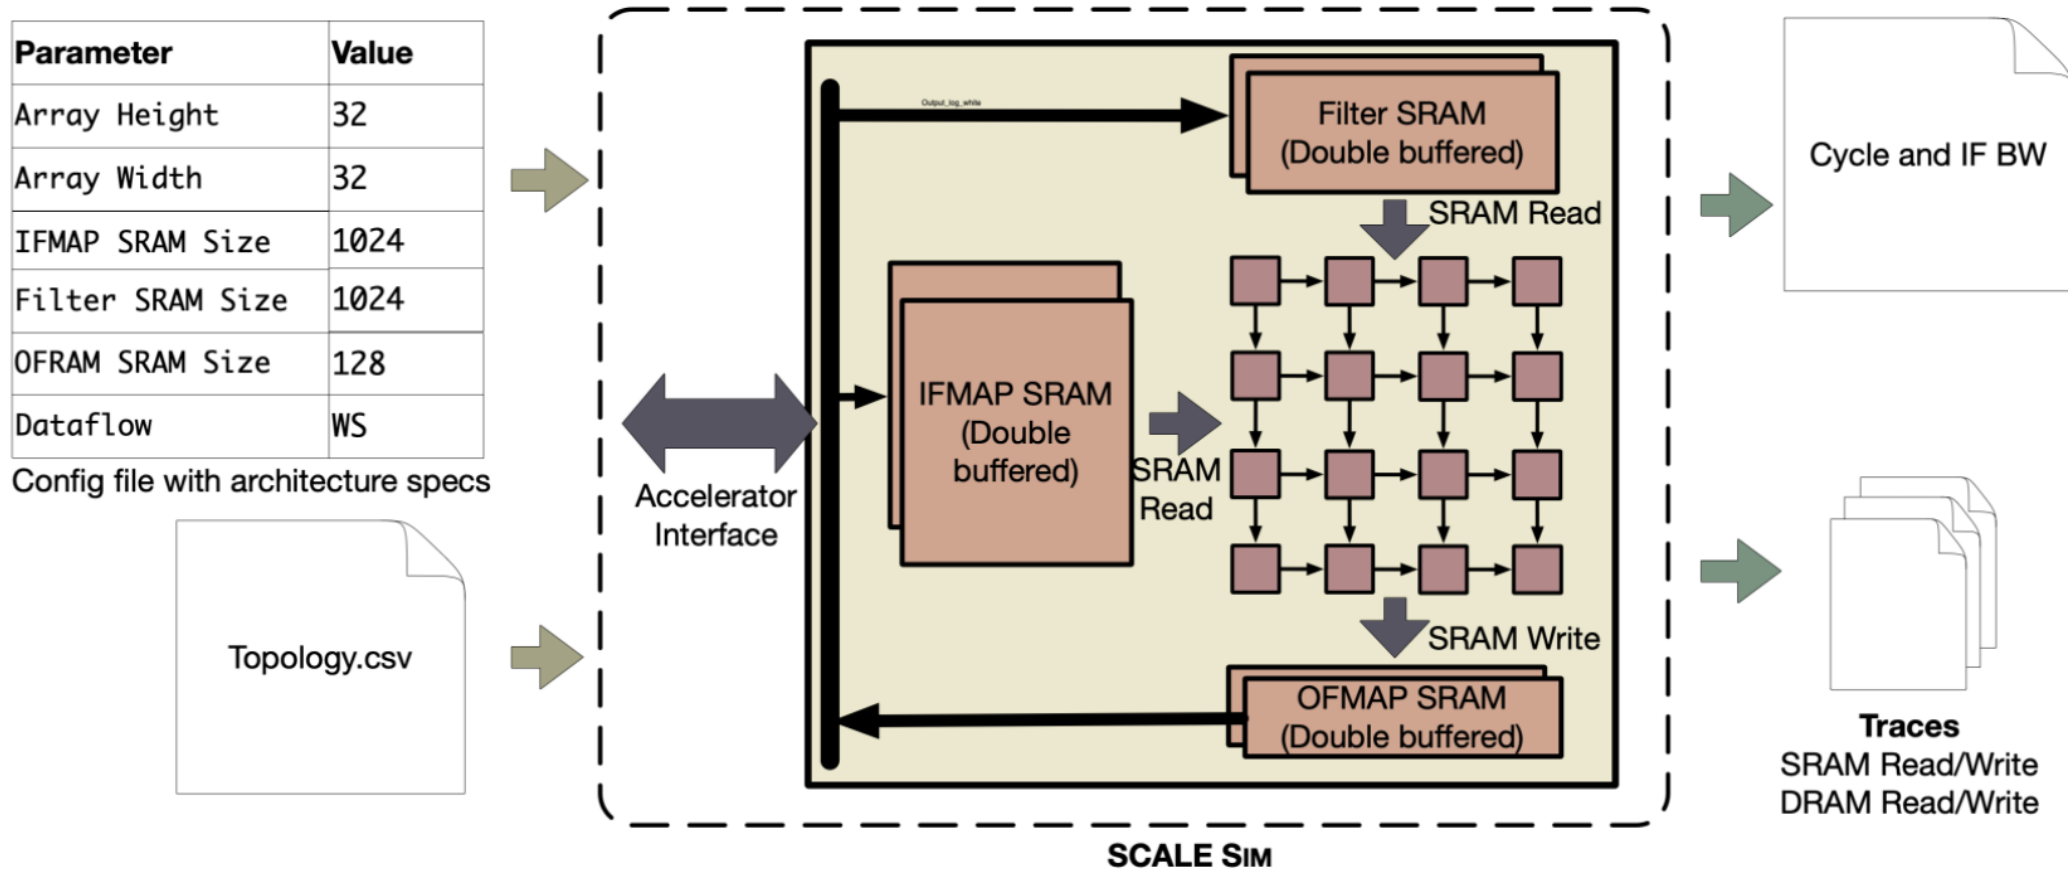

```
# For data-parallel
$ python3 gen_astrasim_workload_input.py \
  --datatype_size=2 \
  --mnk=mnk_inputs/example.csv \
  --num_npus=16 \
  --num_packages=2 \
  --output_file=../../inputs/workload/example_DATA.txt \
  --parallel=DATA \
  --run_name=example \
  --scalesim_config=../../extern/compute/SCALE-Sim/configs/google.cfg \
  --scalesim_path=../../extern/compute/SCALE-Sim
```

Sample MNK input file

	A	B	C	D	E
1	Layer	m	n	k	
2	MLP_Bottom	1024	128	512	
3	MLP_Bottom	1024	512	512	
4	MLP_Bottom	1024	512	512	
5	MLP_Bottom	1024	512	16	
6	MLP_Top_0	1024	1024	512	
7	MLP_Top_1	1024	512	512	
8	MLP_Top_2	1024	512	512
